LOOKING FOR A COMPLEX POWER DESIGN?

Astrodyne TDI Develops Custom Power System Solutions

Custom Power Distribution Units (PDUs) offer effective and efficient implementation of power distribution, safety features, remote communication, output monitoring, and control. With experience in power supplies, EMI filters, and integration, we provide develop custom PDUs to support the semiconductor capital equipment market. Current capabilities range from small PDUs delivering 100's watts to large-scale Power Systems delivering 100's kilowatts. Supported power input sources include uninterruptible power supplies (UPS), power supplies (PSU), and utility power sources (AC Main), or battery power (DC); with the ability to support additional power sources available upon request.

POWER CONVERSION

Astrodyne TDI's PDUs can provide power conversion elements, such as AC-DC, DC-DC, or DC-AC converters. They may also include AC-AC transformers for isolation, step-up, step-down, and/or power conditioning.

POWER CONDITIONING

Integrate EMI filters that are specifically tailored to suppress noise generated by connected equipment, or from input power surges, such as those specified by IEC-61000.

POWER CONTROL

Astrodyne TDI's PDU can provide DC bias voltage for connected system control functions and monitoring of input and delivered power. A bias voltage may be made independent of system interlock and EMO functions. It can also facilitate system maintenance and troubleshooting with some common protocols.

POWER PROTECTION

PDUs can function as part of a system or safety interlock process, where power delivery to connected equipment is coordinated with various distributed system controls and switches.

AC, DC, and Coolant Distribution & Management with Hot-Swap Modules

System protection features

DC power distribution via heavy duty bus bars and cabling that interconnect module shelves

AC distribution to modules

Water cooling manifolds provide cooling liquid to each module with just one inlet and exit
